

Guidance on updating Codelists after ICD-10 update

- *Is this one of your own codelists?*
 - **Yes:** Make sure you're on the most recent version of the codelist (see Fig 1) and create a new version (the blue button on the top right)
 - **No:** Try to contact the codelist owner and request they create a new version. If this is not possible then you can [clone the codelist](#) to your own account. Make sure you're cloning the latest version (see Fig 1).
- *Are there any unresolved codes?*
 - **Yes:**
 - *Are they modified codes (see Fig 2)?*
 - **Yes:** In most cases you will want to include all of these. The easiest way is to un-select the currently included parent code (by clicking on the blue plus sign, which will turn it white) and then clicking on it again to include. Don't save the draft codelist between un-selecting this code and including it as it may disappear from the codelist.
 - **No:** Check the definition of each to see if it meets your requirements
 - **No:** there are no additional ICD-10 codes that could be included in your codelist.
- *Are there any warnings?*
 - **Yes:** Review each one and decide what should be included to meet the purposes of your codelist. Specific guidance on this is available in the [OpenCodelists docs](#).
 - **No:** Your codelist should be fully up to date and ready to use.
- Save your codelist for review. If you are happy that no further review is required, then you may wish to publish it.
- Update the code for any of your in-progress OpenSAFELY studies that use this codelist:
 - Update `codelists.txt` - find the line for this codelist and replace it with a suitable line for the updated version, or delete the line and use `opensafely codelists add [url-for-the-new-version]` to add it. Further guidance on this process is available on the ['adding codelists to a project' OpenSAFELY docs](#).
 - Run `opensafely codelists update`
 - If you find that the csv file for this codelist in the `codelists/` folder has changed, you will need to update the line(s) of your study code that load it using the `codelist_from_csv` function such that they point at the new filename. If you have cloned the codelist, then this step will always be required.

Figure 2: An example of an included code (M602) with unresolved descendant codes that are modified codes. They can be identified as modified codes as they have an additional fifth character (in some cases may be fourth) and their description is the same as the ancestor code but with an additional specifier following a colon (":") character.
